

# Interrupt Generation Using the AT91 Timer/Counter

## Introduction

This application note describes how to generate an Interrupt by using the Timer/Counter (TC) in the AT91 series of microcontrollers.

## Timer/Counter Overview

The AT91 series features a Timer/Counter block, which includes three identical 16-bit timer counter channels. Each channel can be independently programmed, through its two operating modes, to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing, pulse width modulation and interrupt generation.

Each Timer Counter channel has 3 external clock inputs, 5 internal clock inputs, and 2 multi purpose input/output signals, which can be configured by the user. Each channel drives an internal interrupt signal, which can be programmed to generate processor interrupts via the Advanced Interrupt Controller (AIC). The three Timer Counter channels are independent and identical in operation. Each Timer Counter channel is organized around a 16-bit counter. The value of the counter is incremented at each positive edge of the selected clock. When the counter has reached the value 0xFFFF and passes to 0x0000, an overflow occurs and the bit COVFS in TCx\_SR (Status Register) is set.

The current value of the counter is accessible in real-time by reading TCx\_CV. A trigger can reset the counter. In this case, the counter value passes to 0x0000 on the next valid edge of the selected clock.

## Operating Modes

Each Timer Counter channel can operate independently in two different modes:

- Capture Mode allows measurement on signals
- Waveform Mode allows wave generation

The Timer Counter Operating Mode is programmed with the WAVE bit in the TC Channel Mode Register (TCx\_CMR). In Capture Mode, TIOA and TIOB are configured as inputs. In Waveform Mode, TIOA is always configured to be an output and TIOB is an output if it is not selected to be the external trigger.

## Trigger

A trigger resets the counter and starts the counter clock. Three types of triggers are common to both modes, and a fourth external trigger is available to each mode.

### Common Triggers

The following triggers are common to both operating modes:

- Software Trigger: Each channel has a software trigger, available by setting SWTRG in TCx\_CCR.
- SYNC: Each channel has a synchronization signal SYNC. When asserted, this signal has the same effect as a software trigger. The SYNC signals of all channels are asserted simultaneously by writing TC\_BCR (Block Control) with SYNC set.
- Compare RC Trigger: RC is implemented in each channel and can provide a trigger when the counter value matches the RC value if CPCTRG is set in TCx\_CMR.

### External Trigger

The Timer Counter channel can also be configured to have an external trigger. In Capture Mode, the external trigger signal can be selected between TIOA and TIOB. In Waveform Mode, an external event can be programmed on one of the following signals: TIOB, XC0, XC1 or XC2. This external event can then be programmed to perform a trigger by setting ENETRIG in TCx\_CMR.

If an external trigger is used, the duration of the pulses must be longer than the system clock (MCK) period in order to be detected.

# Interrupt Generation Using AT91 Timer/Counter

## Timer/Counter Block Diagram

Figure 1. Timer/Counter Block Diagram

## Clock Source

Each channel can independently select an internal or external clock source for its counter:

- Internal clock signals: MCK/2, MCK/8, MCK/32, MCK/128, MCK/1024
- External clock signals: XC0, XC1 or XC2

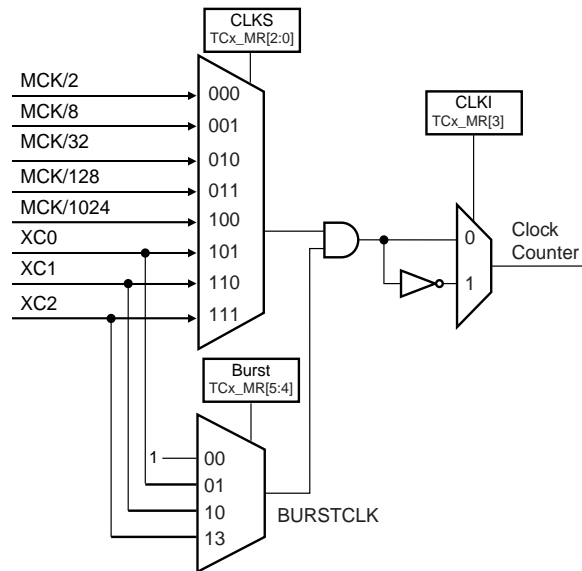

The three-bit TCCLKS field of the mode register TCx\_CMR determines whether the counter is clocked by one of the five internal clock sources (MCK/x) or one of the three external clock sources (TCLKx).

The selected clock can be inverted with the CLKI bit in TCx\_CMR (Channel Mode Register). This enables counting on the opposite edges of the clock.

The burst function allows the clock to be validated when an external signal is high. The BURST parameter in the Mode Register defines this signal (none, XC0, XC1, XC2).

**Note:** In all cases, if an external clock is used, the duration of each of its levels must be longer than the system clock (MCK) period. The external clock frequency must be at least 2.5 times lower than the system clock (MCK).

**Figure 2.** Timer/Counter Clock Source

The maximal counter duration when an internal clock is used, is determined by the internal clock MCK and the prescaler number:

$$\text{maximal counter duration (seconds)} = 2^{16}/F_{TC} \text{ where } F_{TC} \text{ is in Hz.}$$

$$\text{counter resolution} = 1/F_{TC}$$

**Table 1.** Maximum Counter Duration for Various MCK

MCK	5 MHz	10 MHz	20 MHz	33 MHz	66 MHz
MCK/2	26.21ms	13.10ms	6.55ms	3.97ms	1.98ms
MCK/8	104.8ms	52.4ms	26.22ms	14.89ms	7.45ms
MCK/16	419.4ms	209.7ms	104.86ms	63.86ms	31.98ms
MCK/128	1.68s	838.8ms	420.4ms	254.2ms	127.1ms
MCK/1024	13.42s	6.71s	3.36ms	2.03s	1.02s

## Timer Interrupt Generation

Each Timer/Counter channel drives an internal interrupt signal which can be programmed to generate processor interrupts via the AIC (Advanced Interrupt Controller). Each Timer/Counter channel contains a total of 8 interrupts, which can be enabled or disabled from the registers TCx\_IER and TCx\_IDR. The interrupts are available according to the operating mode as shown below in Table 2.

**Table 2.** Operating Mode Interrupts

Interrupt	Capture Mode	Waveform Mode
Counter Overflow Interrupt COVFS	X	X
Load Overrun Interrupt LOVRS	X	
Compare Register A Interrupt CPAS		X
Compare Register B Interrupt CPBS		X
Compare Register C Interrupt CPCS	X	X
Load Capture Register A Interrupt LDRAS	X	

## Application Example

Use the AT91 Timer/Counter to generate an interrupt and blink one LED every 1s. This application example is based on the AT91EB40A Evaluation Board but is applicable to all AT91 products.

### Timer configuration

The RC can generate a trigger if bit CPCTRG in the TC Mode Register is set to 1. A trigger resets the counter so that RC can control the timer period needed. The RC compare interrupt will be used to generate an interrupt every 1s. The RC compare interrupt is available in both mode, compare and waveform modes so the timer can be configured even in compare mode or in waveform mode.

The Master Clock MCK on the AT91EB40A Evaluation Board is 66 MHz. As described previously, the timer period is controlled by the compare register RC. The value needed must be determined in the compare register C in order to obtain a timer period of 1s.

The minimal prescaler value required to select the timer clock  $F_{TC}$  must first be determined. The maximal counter value is 0xFFFF (65535):

$$DIV_{min} = t \times \frac{MCK}{65535} = 1 \times \frac{66000000}{65535} = 1007.095$$

The value  $\geq 1007.095$  is  $DIV = 1024$ . Therefore the timer clock  $F_{TC}$  must be at least  $MCK/2$   $MCK/1024$  to have a RC compare period of 1s.

In an application, the required compare register values must be calculated using the following equation:

$$\text{Compare Value} = (t \times F_{TC})$$

Where

$t$  = desired timer compare period (second)

$F_{TC}$  = timer clock frequency(Hertz)

Compare register RC:

$$RC = (t \times F_{TC})$$

$$\Rightarrow RC = 1 \times \frac{66000000}{1024} = 64453 = 0 \times \text{FBC5}$$

## Software Code

The following software code example blinks LED8 on the AT91EB40A Evaluation Board every 1s using the Timer/Counter 1 RC compare interrupt and is applicable to the entire AT91 series.

This software example is built around two files:

- **irq\_timer.s** assembly file which defines the assembler timer interrupt assembly handler.
- **timer\_interrupt.c** C file which includes the main function with the timer configuration and the C timer interrupt handler.
